

## Heat Exchanger Protective Coatings

Protective Coatings Serck provide protective and restorative coatings on heat-exchangers, tube sheets, channel heads, tanks and water boxes - extending the units life cycle and avoiding unnecessary costly repairs and shut downs.

The unique tube lining coating system protects the tubes in and outlets and can also be applied to the full tube length. The system will also seal any small tube leaks. It supersedes the insert fixing technology and gives better performance. The systems can be applied on-site or at Serck facilities.

Coating are applied on Sea Water Condensers, Desalination plants, FWG Condensers to protect from corrosion and erosion
